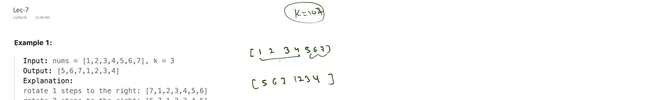
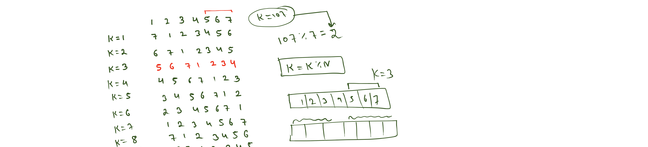
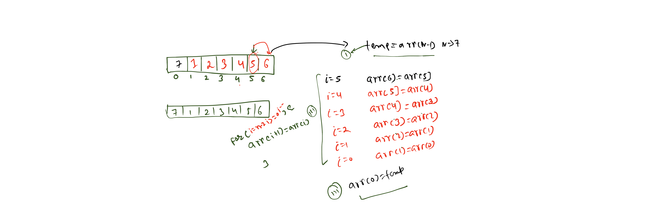
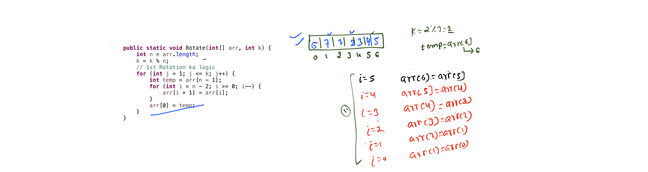
Example 1:

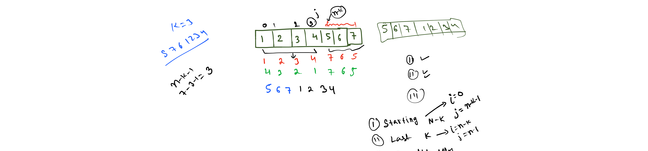
```
Input: nums = [1,2,3,4,5,6,7], k = 3
Output: [5,6,7,1,2,3,4]
Explanation:
rotate 1 steps to the right: [7,1,2,3,4,5,6]
rotate 2 steps to the right: [6,7,1,2,3,4,5]
rotate 3 steps to the right: [5,6,7,1,2,3,4]
```

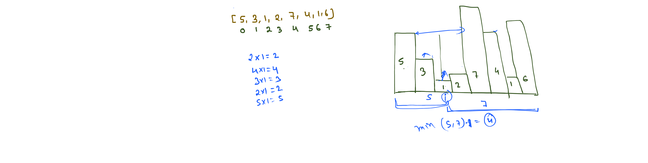


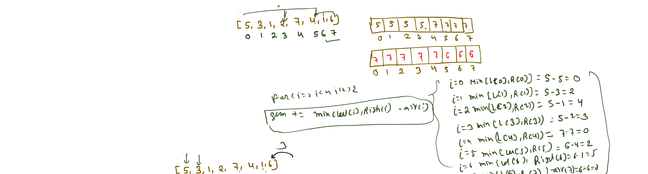


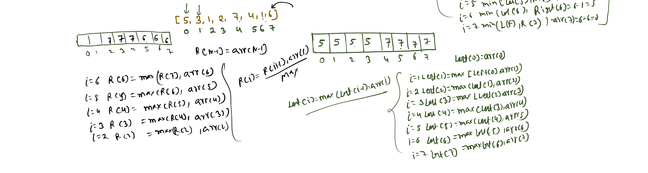








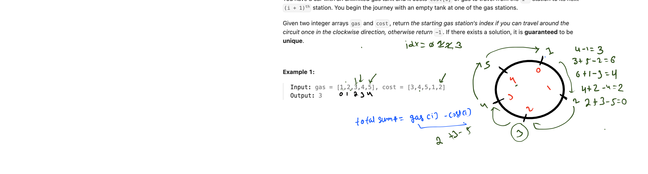




There are `n` gas stations along a circular route, where the amount of gas at the i^{th} station is `gas[i]`.

You have a car with an unlimited gas tank and it costs `cost[i]` of gas to travel from the i^{th} station to its next `(i + 1)`th station. You begin the journey with an empty tank at one of the gas stations.

Given two integer arrays `gas` and `cost`, *return the starting gas station's index if you can travel around the circuit once in the clockwise direction, otherwise return* `-1`. If there exists a solution, it is **guaranteed** to be **unique**.

Example 1:


```
Input: gas = [1,2,3,4,5], cost = [3,4,5,1,2]
Output: 3
```
